

Say what you're doing.

Nova A blank screen that builds itself around you.

Every app was a detour.

Find it. Open it. Learn it. Switch to the next one. We spent forty years learning to navigate software.

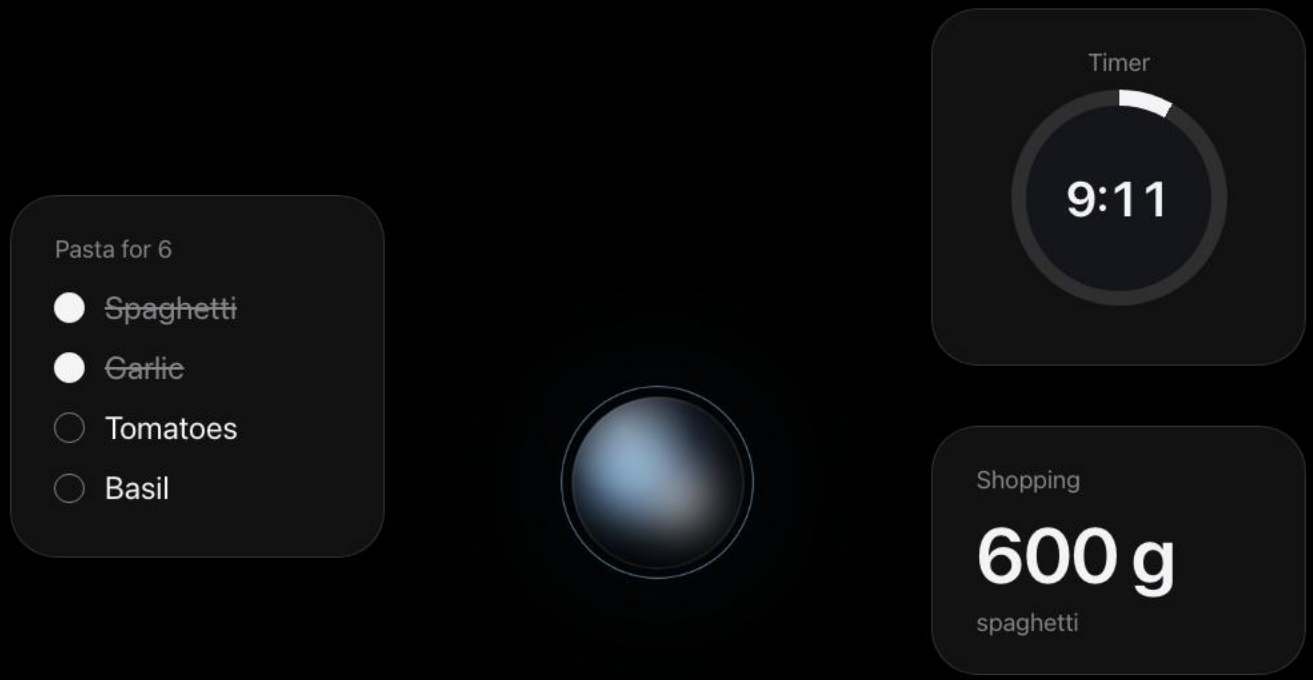

The software should come to you.

If AI understands what you want, why should you have to find the right app?

One orb. Nothing else.

No apps. No windows. No chat box. You talk, and it listens.

Say it. It appears.

“I’m cooking pasta for four.” Then: “Make it six.” The same widgets update.

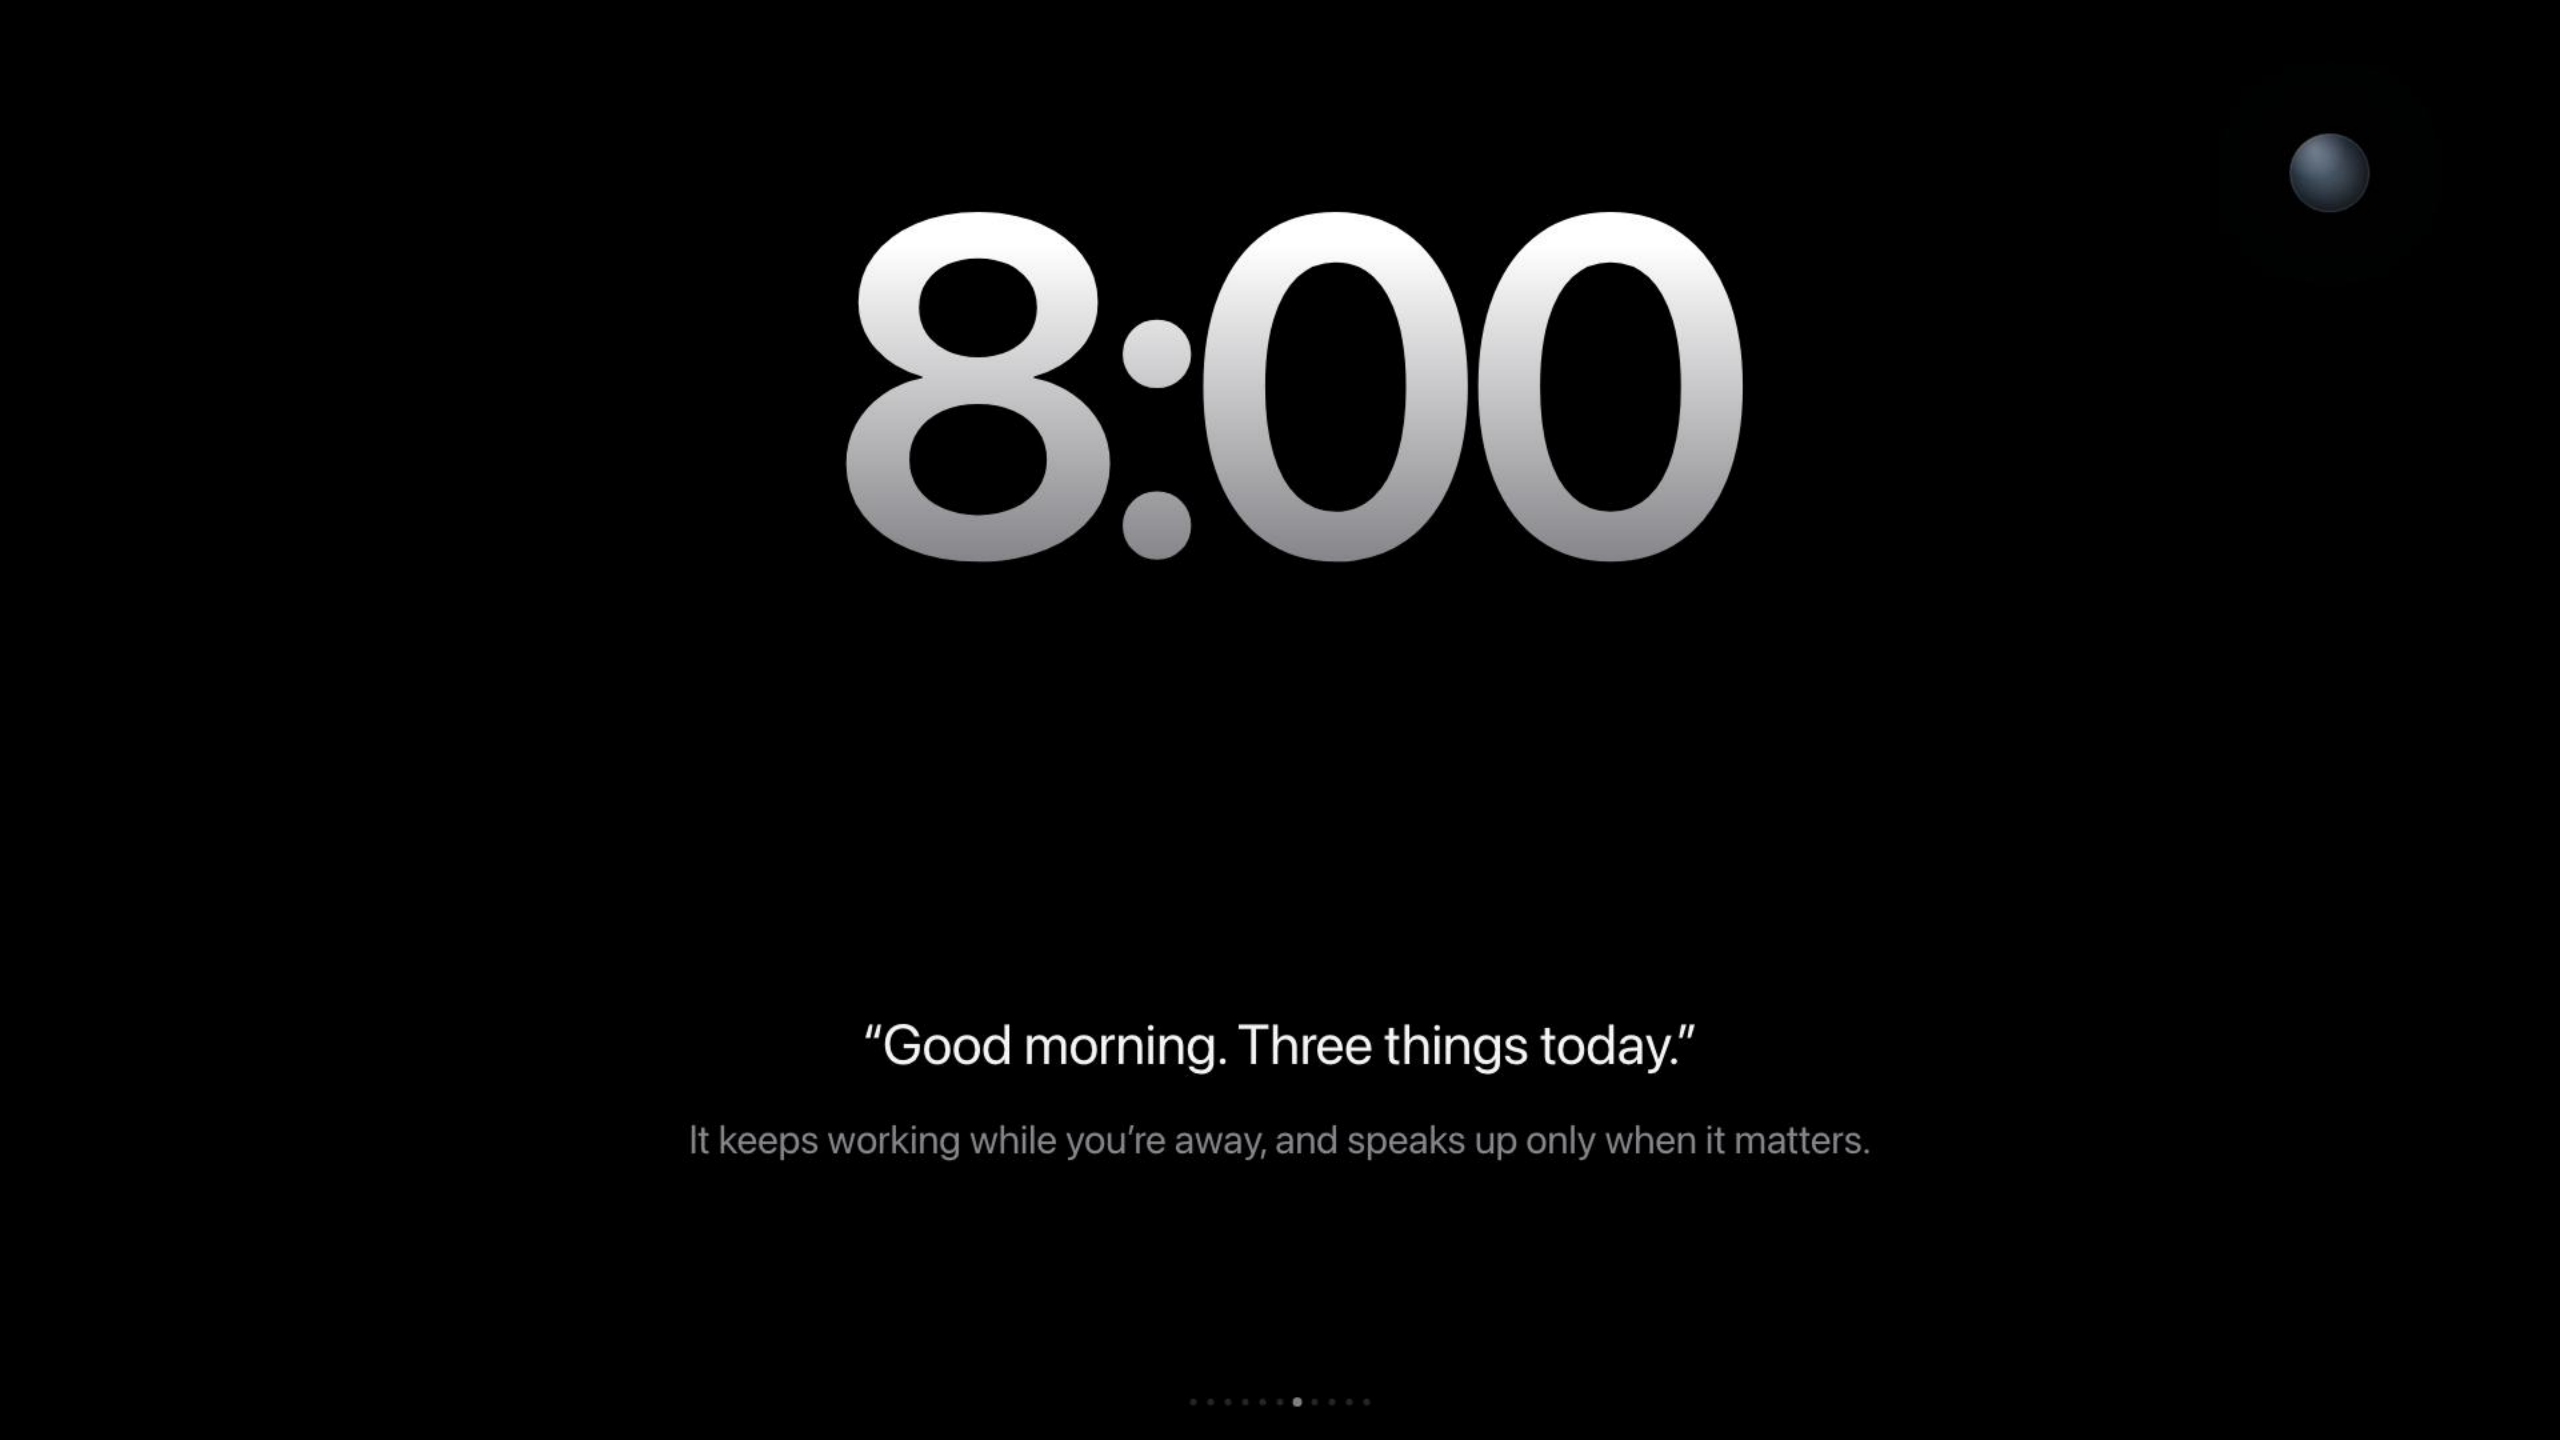

Say you're done.
It's gone.

Back to one orb. Nothing to close. Nothing left behind.

It can see.
Only if you say yes.

“Want me to take a look at your screen?” Nothing is captured until you answer. Nothing is stored after.

8:00
“Good morning. Three things today.”
It keeps working while you’re away, and speaks up only when it matters.

Small on your Mac.
Big when it matters.

Runs on this Mac. Hears, sees, answers.

Claude. Hard problems only.

The cloud teaches. The Mac remembers.

When Claude builds something new, it's saved. The next time you ask, it's instant, on your device, and free.

0.3 s

From letting go to hearing the answer. On a laptop with 8 GB of memory.

0.17 s
to stop mid-sentence when you interrupt

1.6 GB
of memory for the whole model

100+ turns
of conversation, with perfect recall

Stop finding the app.

Just say what you're doing.
